General Information

The Isolation Link is used in series with Bay-O-Net type expulsion fuses to provide extra protection during re-fusing operations.

They are coordinated to operate at currents that exceed the one-shot rating of the expulsion fuse used in pad or vault type transformers. The isolation link will melt during transformer failure, so the opened primary circuit of a failed transformer cannot be re-energized by the line crew.

BEYOND THE STANDARD

Ordering Information

Use the chart below to cross-reference the Isolation Link required for the fuse element.

Fuse Combination		
Fault Sensing Fuse Link

For more information about
Isolation Links, contact your
Ermco Components representative or call
(877) 267-1855

Installation

No special tools are required. Isolation links are bolted onto the Bay-O-Net fuse assemblies in series between the primary transformer bushing and primary coil.

Isolation Fuse Link (Minimum Melting Time Current Curves)
